Notes: **CI** = confidence interval; **HR** = hazard ratio; **NA** = not available; **NR** = not reported; **OR** = odds ratio; **RR** = relative risk.  
<sup>a</sup>Calculation based on reported data.  
<sup>b</sup>Calculation based on reported data using exact confidence limits.  
<sup>c</sup>Poisson multivariate model.  
<sup>d</sup>Proportion of persons with implant failure; unable to calculate proportion of failed implants by smoking status.  
<sup>e</sup>Proportion of patients with implant loss; proportion of implants lost by smoking status was not reported and could not be calculated.  
<sup>f</sup>Confidence interval was not reported; model included type of restoration and type of implant.  
<sup>g</sup>Confidence interval was not reported.  
<sup>h</sup>95% confidence interval was calculated from reported data.  
<sup>i</sup>Proportion of patients with implant loss; proportion of implants lost by smoking status was not reported.  
<sup>j</sup>Mantel-Haenszel adjusted for diabetes status.  
<sup>k</sup>Proportion of persons with implant failure; proportion of implants failed was not reported.

**Table 10.15S Studies on the association between smoking and rheumatoid arthritis (RA) severity**

Study	Population	Tobacco exposure	Outcome	Findings
Saag et al. 1997	• 336 RA patients	Current, former, never, pack-years	Larsen score, RF positivity, and presence of nodules	<ul style="list-style-type: none"> <li>• Pack-years of cigarette smoking was significantly associated with RF positivity, radiographic erosions, and nodules</li> </ul>
Wolfe 2000	• 610 RA patients	Nonsmoker, former, smoker, pack-years	Complete joint examination, health status questionnaires, RF values, Larsen score, nodules	<ul style="list-style-type: none"> <li>• RF concentration and nodule formation were linearly related to the number of years smoked</li> <li>• Nonlinear relationships were found between smoking and Larsen score and pulmonary illness</li> </ul>
Mattey et al. 2002	• 164 women with established RA	Past, current, never, pack-years	HAQ score, Larsen's score	<ul style="list-style-type: none"> <li>• Ever having smoked was associated with a worse radiographic and functional outcome than was never having smoked</li> <li>• Both past and current smoking were associated with increased disease severity</li> </ul>
Turesson et al. 2003	• 609 RA patients	Ever, never	Presence of extra-articular disease	<ul style="list-style-type: none"> <li>• Main predictor of severe extra-articular manifestations was smoking at RA diagnosis</li> </ul>
Papadopoulos et al. 2005	• 293 early RA (<2 years) patients	Current, ex-smokers, nonsmokers	DAS-28, Larsen's score, presence of nodules	<ul style="list-style-type: none"> <li>• Smoker patients had higher DAS-28, and higher Larsen's score as compared to nonsmokers at diagnosis and at follow-up</li> <li>• Smokers more frequently had rheumatoid nodules than the ex-smokers and nonsmokers</li> </ul>
Nyhall-Wahlin et al. 2006	• 112 patients with RA nodules	Current, former, nonsmoker	Presence of nodules	<ul style="list-style-type: none"> <li>• Strong association between smoking and rheumatoid nodules in early seropositive rheumatoid arthritis</li> </ul>
Finckh et al. 2007	• 2,004 RA patients	Nonsmoker, smoker, pack-years	Ratingen score	<ul style="list-style-type: none"> <li>• Radiographic joint damage progressed at a similar rate in current smokers and nonsmokers</li> <li>• Smoking intensity was associated with a significant inverse dose-response</li> <li>• Heavy smokers (&gt;1 pack-day) progressed significantly less than nonsmokers or moderate smokers</li> </ul>
Mikuls et al. 2008	• 300 African American early RA (<2 years) patients	Current, former, never, pack-years	IgA RF serum concentration, nodules	<ul style="list-style-type: none"> <li>• Current smokers were approximately twice as likely as never smokers to have higher IgA-RF concentrations and nodules</li> </ul>
Kim et al. 2008c	• 405 RA patients	Smoker (past or current), nonsmoker	Presence of extra-articular disease	<ul style="list-style-type: none"> <li>• Smoking was closely associated with extra-articular manifestation</li> </ul>
Naranjo et al. 2010	• 7,307 RA patients	Never, former, current	DAS-28, RF, nodules, erosions	<ul style="list-style-type: none"> <li>• Ever smokers were more likely to be RF-positive</li> <li>• Rheumatoid nodules were more frequent in ever smokers</li> <li>• Erosive arthritis and extra-articular disease were similar in all smoking categories</li> <li>• Mean DAS28 was similar in nonsmokers vs. those who had ever smoked</li> </ul>

Table 10.15S Continued

Study	Population	Tobacco exposure	Outcome	Findings
Ruiz-Esquide et al. 2011	• 156 early RA (<2 years) patients	Never, ever, past, current	Disease activity (EULAR), Larsen score,	<ul style="list-style-type: none"> <li>• No difference in disease activity between smokers and nonsmokers</li> <li>• Current smoking associated with radiographic progression of disease</li> </ul>
Andersson et al. 2012	• 1,460 early RA (<2 years) patients	Smoker, nonsmoker, pack-years	Disease activity (EULAR response), comorbidities, death	<ul style="list-style-type: none"> <li>• No difference in EULAR responses between smoking groups but high risk of cardiovascular mortality and morbidity in smokers with RA</li> </ul>
Moura et al. 2012	• 262 RA patients	Smoker, nonsmoker	Presence of extra-articular disease	<ul style="list-style-type: none"> <li>• Current smoking correlated with presence of extra-articular disease</li> </ul>
Söderlin et al. 2013	• 1,421 RA patients	Secondhand smoke	Disease activity (EULAR response)	<ul style="list-style-type: none"> <li>• No association between secondhand exposure and disease activity</li> </ul>

Note: **DAS-28** = disease activity scale 28; **EULAR** = European League Against Rheumatism; **HAQ** = health assessment questionnaire; **IgA** = immunoglobulin A; **RF** = rheumatoid factor; **RR** = relative risk; **SE** = standard error.

**Table 10.16S Studies on the association between smoking and rheumatoid arthritis (RA) treatment response**

Study	Population	Tobacco exposure	Outcome	Findings
Hyrich et al. 2006	• 2,879 patients receiving infliximab or etanercept	Current smoker	EULAR disease response	• Current cigarette smoking was associated with lower response rate among patients receiving infliximab, OR = 0.77 (95% CI, 0.60–0.99)
Inokuma et al. 2008	• 5,043 RA patients on leflunomide	Smoking history	Leflunomide lung injury	• Smoking is a risk factor for developing leflunomide-associated lung injury, OR = 3.12
Westhoff et al. 2008	• 896 early RA patients	Never, quit before RA onset, smoked continuously, pack-years	Drug need	• Current RF+ smokers had taken more DMARD combinations (35.8%) or biologics (14.9%) than RF+ previous smokers (29.9% and 11.2%, respectively) and RF+ never smokers (20.3% and 8.1% respectively), $p = 0.022$ for DMARDs and $p = 0.105$ for biologics
Mattey et al. 2009	• 154 RA patients starting anti-TNF drug	Never, past, current, pack-years	EULAR disease response	• Increasing trend of no response with increasing pack-years at 3 and 12 months ( $p$ trend = 0.008 and 0.003, respectively) • DAS28 was inversely associated with number of pack-years ( $r = -0.28$ ; $p = 0.002$ )
Abhishek et al. 2010	• 395 RA patients starting their first anti-TNF drug	Current, ex-smoker, nonsmoker	EULAR disease response	• Current smoking reduced the chance of achieving at least a moderate response on the EULAR response criteria when compared with nonsmokers, AOR = 0.20 (95% CI, 0.05–0.83; $p = 0.03$ )
Saevarsdottir et al. 2011	• 535 early RA patients starting MTX and anti-TNF drug	Current, past, never	EULAR disease response	• Compared with never smokers, current smokers were less likely to achieve a good response at 3 months following the start of MTX (27% vs. 36%; $P = 0.05$ ) and at 3 months following the start of anti-TNF drugs (29% vs. 43%; $p = 0.03$ )
Canhão et al. 2012	• 617 RA patients starting their first anti-TNF drug	Ever, never	EULAR disease response	• Smoking was negatively associated with good disease response, OR = 0.98 (95% CI, 0.55–1.71; $p = 0.009$ )
Khan et al. 2012	• 150 RA patients receiving rituximab	Current, previous, never	DAS28 score	• Never smokers had the highest falls in DAS28 scores (mean 2.72, SD 0.94) • Previous smokers had fewer falls (mean 1.49, SD 0.92) • Current smokers the least falls (mean 0.63, SD 1.09; $p < 0.001$ by one-way analysis of variance)
Soderlin et al. 2012	• 934 RA patients starting their first anti-TNF drug	Current, previous, never, pack-years	EULAR disease response	• Current smoking was predictive of poor response, OR = 0.53 (95% CI, 0.32–0.87; $p = 0.012$ )

*Note:* **AOR** = adjusted odds ratio; **CI** = confidence interval; **DAS-28** = disease activity scale 28; **DMARD** = Disease-Modifying Antirheumatic Drug; **EULAR** = European League Against Rheumatism; **MTX** = methotrexate; **OR** = odds ratio; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **RF** = rheumatoid factor; **SD** = standard deviation; **TNF** = tumor necrosis factor.

**Table 10.17S Studies on the association between smoking and systemic lupus erythematosus (SLE) risk**

Study	Population	Tobacco exposure	Outcome	Findings
Ekblom-Kullberg et al. 2013	<ul style="list-style-type: none"> <li>• 223 SLE cases</li> <li>• 1,538 controls</li> </ul>	Never, ever, past, current, daily, occasional	Diagnosis of SLE	<ul style="list-style-type: none"> <li>• In women with a history of daily smoking for more than 1 year, OR for SLE = 1.45 (95% CI, 1.07–1.97), in current daily smokers as compared to never smokers, OR = 1.55 (1.00–2.40), and in ex-smokers vs. never smokers OR = 1.80 (1.15–2.83)</li> <li>• Number of men with SLE, who smoked &gt;100 cigarettes during their lifetime was higher than in male controls (p = 0.026)</li> </ul>

Note: **CI** = confidence interval; **DLE** = discoid lupus erythematosus; **IRR** = incidence rate ratio; **OR** = odds ratio; **RR** = relative risk.

**Table 10.18S Studies on the association between smoking and systemic lupus erythematosus (SLE) severity and manifestations**

Study	Population	Tobacco exposure	Outcome	Findings
Ward and Studenski 1992	• 160 adults with SLE nephritis	Nonsmoker, former, current	Development of ESRD	• Smoking status at onset of nephritis was strongly associated with differences in time to development of ESRD with a median time of developing ESRD at 146 months for smokers and 273 months for nonsmokers
Ghaussey et al. 2003	• 111 SLE cases	Never, ex-smoker, current	SLEDAI	• Current smokers demonstrated significantly higher SLEDAI scores than ex-smokers and never smokers
Calvo-Alén et al. 2005	• 570 SLE cases	Never, ever	Presence of thrombotic event	• Smoking is a significant risk factor for thrombosis
Freemer et al. 2006	• 410 SLE cases	Never, former, current	Serum dsDNA antibodies	• Significantly higher risk of dsDNA seropositivity in current smokers than former or never smokers
Kaiser et al. 2009	• 1930 SLE cases	Never, ever	Presence of thrombotic event	• Smoking was a significant risk factor for thrombosis
Turchin et al. 2009	• 276 SLE cases	Never, past, current	Cumulative cutaneous damage scores	• Current smoking is associated with scarring and active lupus rash
Barta et al. 2010	• 181 women with SLE	Never, past, current	Health related quality of life	• Smokers more likely to have poor health related quality of life compared to nonsmokers
Piette et al. 2012	• 218 CLE or SLE cases	Never, past, current	Disease severity, response to treatment, quality of life	• Current smokers with SLE had worse disease and worse quality of life than nonsmokers
Bourré-Tessier et al. 2013	• 1,346 SLE cases	Never, ever, past, current, pack-years	SLEDAI-2K, cutaneous ACR criteria	<ul style="list-style-type: none"> <li>• Current smoking was associated with active rash, as recorded by the SLEDAI-2K, OR = 1.63 (95% CI, 1.07–2.48) for current vs. noncurrent smokers, and OR = 1.68 (95% CI, 1.08–2.60) for current vs. never smokers</li> <li>• Ever smoking was associated with the presence of cutaneous ACR criteria, OR = 1.50 (95% CI, 1.22–1.85)</li> <li>• Association driven by discoid rash, OR = 2.36 (95% CI, 1.69–3.29) and photosensitivity, OR = 1.47 (95% CI, 1.11–1.95)</li> <li>• Higher pack-years was associated with the presence of active rash among current smokers, RR/5 pack-years = 1.17 (95% CI, 1.06–1.29).</li> </ul>

*Note:* **ACR** = American College of Radiology; **CI** = confidence interval; **CLE** = cutaneous lupus erythematosus; **dsDNA** = double-stranded DNA; **ESRD** = end stage renal disease; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **OR** = odds ratio; **RR** = relative risk; **SLEDAI** = systemic lupus erythematosus disease activity index.

**Table 10.19S Studies on smoking and systemic lupus erythematosus (SLE) treatment response**

Study	Population	Tobacco Exposure	Outcome	Findings
Wahie et al. 2011	• 200 cases with DLE (11 with SLE) on hydroxychloroquine	Nonsmoker, smoker	Clinical response to hydroxychloroquine	• No significant difference in response rate between nonsmokers compared with smokers (OR = 0.78; 95% CI: 0.43–1.45; p = 0.27)
Jewell and McCauliffe 2000	• 61 cases (47 DLE, 14 SCLE)	Nonsmoker, ex-smoker, smoker, pack-years	Skin disease response to therapy	• A significant difference (p <.0002) in antimalarial response rate was observed for smokers (40%) vs. nonsmokers (90%)

Note: **CI** = confidence interval; **CLE** = cutaneous lupus erythematosus; **DLE** = discoid lupus erythematosus; **ESRD** = end stage renal disease; **OR** = odds ratio; **pack-years** = the number of years of smoking multiplied by the number of packs of cigarettes smoked per day; **SCLE** = subacute cutaneous lupus erythematosus.
